

GRAVITY, BLACK HOLES AND THE UNIVERSE

IAIN NICOLSON

Does gravity vary with time? Do black holes power quasars and galaxies? Does the Sun have a black hole companion? Can diminished black holes explode? And is the universe fated to die, or is it eternally renewable?

This revealing new study traces, in straightforward terms, the development of our changing view of gravity – from Aristotle to Einstein – and examines its mysterious role in the universe, particularly in black holes, those enigmatic astrophysical objects where gravitation is extreme and reality itself is distorted.

In itself an exciting exploration of challenging new ideas, this wide-ranging work is also a guide to tomorrow's concepts in science fiction, as well as a survey of established hypotheses from faster-than-light travel to curved space-time or gravitational waves. A timely and important book that could fundamentally alter your outlook on the universe around you.
